

SE Project Presentation Guidelines

Prepare your presentation slides in your own style and with your creativity. There is no fixed template for the presentation. However, your presentation should clearly demonstrate your teamwork, technical understanding, and project outcomes. Each team will have **20–25 minutes**, and every team member must participate in the presentation.

Please include the following topics in your presentation:

1. **Title Slide:** Include the project title, team members' names and IDs, course name, instructor's name, department, and presentation date.
2. **Team Contributions:** Briefly describe the responsibilities and contributions of each team member to demonstrate collaborative work.
3. **Problem Statement:** Clearly explain the problem your project addresses, why it exists, and who is affected by it.
4. **Project Motivation:** Describe the motivation behind choosing the project and the benefits your proposed solution provides over existing approaches.
5. **System Overview:** Provide a high-level overview of the system, including its main functionalities, major modules, and project scope.
6. **Technology Stack:** Present the programming languages, frameworks, databases, libraries, and other technologies used to develop the project.
7. **Development Model and Tools:** Explain the Software Development Life Cycle (SDLC) model followed and introduce the development tools used, such as Git, GitHub, project management tools (e.g. Trello), IDEs, or testing tools.
8. **Challenges and Solutions:** Discuss the major technical or project-related challenges encountered during development and how your team addressed them.
9. **Limitations and Future Work:** Mention the current limitations of the project and suggest possible enhancements or additional features for future development.
10. **Project Demonstration:** Demonstrate the working system by showcasing its key features and workflows. Focus on explaining how the system operates and how it solves the identified problem.

NB:

- Do not include screenshots of your project in the presentation slides. Instead, demonstrate the actual system during the presentation.
- Keep slides concise and visually appealing. Use diagrams, charts, and bullet points instead of large blocks of text.
